

## Web-based Agent and Manager Workplace

Within the **effective**® Network-Based Contact Center, there is an optional web-based Agent Workplace which allows agents to process calls, e-mails, faxes and text messages, access key statistics in real time, process caller data, etc. We have designed the workplace to provide the most commonly used functionality of premise-based systems in your network.

With the web-based Agent Workplace, it is easy to transform any PC into a contact center terminal and integrate additional agents at any site worldwide, e.g. to deal with traffic peaks and/or lower costs.

The **effective**® Network-Based Contact Center also offers an optional web-based Manager Workplace that provides the contact center manager with a web-based overview of all current activities any time and from any place. The manager can access performance data down to the level of call detail records. Web-based online monitoring allows application tracking and call statistics in real time. By monitoring the call status, call duration, or number of active calls, the manager gains a better understanding of the way each particular call is handled. Should it be necessary, the manager can also actively participate in the conversation between a caller and an agent or just listen in and coach the agent by "whispering" instructions to the agent which the caller does not hear.
